

Six hours: understand, compute, then learn

Three 120-minute sessions, each including a 10-minute break.

A

Model & numerical method

120 min

Crack representations → energy & damage → FEM

Explain what the model represents and what the method approximates.

Notebook 00 · Opening prediction (algebraic teaser)

B

Computation & derivatives

120 min

Geometry & loads → PhAST result → checked gradient

Run a small case, interpret its fields, and test a local sensitivity.

Notebooks 01–03 · PhAST, degradation, elastic-bar inverse toy

C

Learning & model interfaces

120 min

Train & reload → compatible proposal → physics check

Evaluate a learned component and explain when correction is needed.

Notebooks 04–05 · Toy field training and checked fallback
